

# Unilux

Unilux strobes make it possible to shoot moving subjects with incredible clarity. These fixtures are often used to shoot things that pour, spritz, pop or splash. The lights flash at 1/100000 a second to create a crisp, sharp image and can be synchronized with the shutter of a wide range of film cameras. The lights have a colour temperature of 6000°K but can be colour corrected using an 85 or 85-B gel.
